Technologies

We rely on proven and innovative technologies in equal measure!

Modern businesses face complex challenges, especially in the areas of IT governance, enterprise risk management, and compliance (GRC), where they must meet both legal and Country-specific IT security requirements. At ASCONSIT, we support you in designing and implementing a sustainable IT security strategy for your company by combining time-tested technologies with more innovative solutions to create a custom approach that is tailored to your company's needs.

SAP

SAP offers both cross-industry and industry-specific solutions in the fields of GRC and identity management. Technical solutions for the separation of functions and monitoring are included in the SAP Compliant Identity Management Suite. SAP Access Control is one of the three pillars of this product group, along with SAP Identity Management and SAP Single Sign-On..

50 years of experience in enterprise software

As one of the world's largest providers of enterprise applications, SAP also offers comprehensive IT security solutions for all business areas. They help to meet current and future security requirements in your company efficiently and sustainably. You too can benefit from 50 years of development experience in the field of IT security software.

SAP Compliant Identity Management

SAP Identity Management (IdM)

SAP Identity Management (IdM) enables you to manage users and their permissions centrally and conveniently across heterogeneous system landscapes. The solution improves process efficiency with a wide range of automation and self-service functionality, while meeting compliance and transparency requirements thanks to integrated reporting and monitoring tools

[SAP Identity Management \(IdM\)](#)

SAP Single Sign-On (SSO)

Requiring every user to have a distinct password for every system is not very efficient and may represent a security risk for the company. These conditions often lead employees to write down their access details or store them in an insecure format. The SAP Single Sign-On (SSO) software solution replaces multiple password prompts across different systems with a single user authentication step. The individual users benefit from simplified processes, and the company benefits from greater levels of security.

[SAP Single Sign-On \(SSO\)](#)

SAP Access Control

When users have several security-relevant authorizations at the same time, this can increase security risk and lead to lack of compliance. SAP Access Control was specifically developed to identify such authorization conflicts and prevent them proactively.

One Identity (OI)

One Identity is a Quest software company that helps organizations to successfully implement professional identity and access management. Its comprehensive product range and holistic approach enables companies to realize their individual IT security strategy locally, in the cloud or in a hybrid environment.

Step by step to holistic IT security

In times of digital transformation, it is more important than ever to minimize the opportunity for internal and external threats. One Identity has developed numerous software modules for this purpose, which complement each other and can be combined with each other for increased security. Thus, the One Identity product range supports companies in implementing a holistic identity-based IT security strategy step by step.

IT security in the digital transformation

OI Identity Manager

Companies have to meet increasingly complex security and IT governance requirements. Identity Manager supports the central administration of identities, including their authorizations, promotes the automation of the related processes and helps to consistently align access management with company-specific business requirements.

OI Safeguard

Accounts with privileged rights are at core of IT security and compliance in companies. One Identity's Safeguard helps to prevent damage caused by data loss or misuse. It offers companies a secure method for protecting privileged accounts and sustainably improving IT security.

OI Starling Cloud-Plattform

Many companies use on-premise software solutions and cloud-based applications. The Starling Cloud Platform from One Identity creates the technical and administrative prerequisites for ensuring that current IT security requirements are met even in a hybrid system environment.
